# Beige Book Deep Dive

*June 2026 Release — Labor Market Signals, Recession Risk & What Standard Data Misses*

| PREPARED FOR | DATE          | PRIMARY SOURCE                                    |
|--------------|---------------|---------------------------------------------------|
| Drew         | June 30, 2026 | Federal Reserve Beige Book, released June 3, 2026 |

DATA COLLECTED THROUGH  
May 27, 2026 (prepared by Kansas City Fed)

# 01 Executive Summary

---

## The one-paragraph version

The June 2026 Beige Book describes an economy growing on paper but fraying underneath. Ten of twelve Districts reported slight-to-moderate growth, one (Philadelphia) contracted slightly, and one (San Francisco) was flat. Headline U.S. data corroborates the "muted but not broken" read: unemployment sits at **4.3%** (BLS, May 2026), Q1 GDP grew **2.1%** (BEA third estimate), and initial jobless claims remain low (~215,000–229,000 weekly through June). But underneath those aggregates, the labor market has effectively stopped moving — hiring, quitting, and firing are all near cycle lows simultaneously (a "low-hire, low-fire" equilibrium) — while a Middle East-driven oil shock pushed headline CPI to **4.2% year-over-year**, the highest since April 2023, and consumer spending has split cleanly by income (a "K-shaped" pattern now confirmed by NY Fed and Bank of America Institute transaction data).

None of the standard recession triggers are flashing red: the Sahm Rule and comparable real-time indicators remain below threshold, layoffs are not rising, and the Fed held rates at 3.50%–3.75% at its June 17 meeting. But a growing body of research — from the Cleveland Fed's own Beige Book text-sentiment model to NY Fed household-debt data to Dallas Fed research on AI-exposed young workers — shows that anecdotal and text-based signals are currently running more pessimistic than the hard aggregate numbers justify. That gap is the central finding of this report, and it is precisely the kind of divergence the Beige Book was designed to surface.

## Bottom line

This is not a recession reading. It is a "soft landing under strain" reading, with a meaningfully elevated tail risk of stagflation if the Middle East energy shock persists. Independent forecasters (J.P. Morgan, U.S. Bank) put 2026 recession odds around 35%; the Cleveland Fed's Beige Book-text model reads in the mid-20s percent range (24% as of its most recent published update, projected ~26.5% later in 2026) — a model whose reliability has degraded since 2022 and should be read as one input, not a verdict.

## 02 What the Beige Book Is (and Isn't)

---

The Beige Book is published eight times a year and summarizes qualitative, anecdotal input gathered by each of the 12 Federal Reserve Banks from businesses, nonprofits, economists, and other contacts in their District. It is explicitly *not* a statistical release and not a statement of Fed policy views. Per the Fed's own framing, its purpose is to "characterize dynamics and identify emerging trends in the economy that may not be readily apparent in the available economic data" — in other words, it is a deliberately leading, qualitative complement to lagging, quantitative series like the jobs report or CPI. That framing is the organizing idea of this whole report: most useful for catching turns before they show up in official numbers, least useful for precise magnitude.

## 03 National Picture

---

### Activity

Ten of twelve Districts grew at a slight-to-moderate pace; Philadelphia contracted slightly; San Francisco was flat. Manufacturing was the strongest broad category — expanding in nine Districts, driven heavily by data-center buildout and defense-related demand — while consumer spending was mixed and increasingly bifurcated by income.

### Labor markets

Employment showed little to no change in eleven Districts; only Cleveland reported clear modest job growth, concentrated in construction tied to data-center projects. The dominant description across the report is "low-hire, low-fire": firms are neither expanding headcount nor cutting it, hiring is selective and concentrated in critical or hard-to-fill roles, and workers are reluctant to switch jobs given the uncertain environment.

### Prices

Inflation picked up to a moderate-to-strong pace, and the report is unusually explicit about the cause: the Middle East conflict and the resulting Strait of Hormuz disruption — which the World Bank called the largest oil-market shock on record, with Brent up roughly 65% at its peak. That energy shock is cascading into shipping, packaging, fertilizer, groceries, and transportation costs across every District.

## 04 Current Economic Data Snapshot

---

Headline figures corroborating (and in places complicating) the Beige Book's qualitative read, for citation against primary sources.

| INDICATOR                                                   | LATEST VALUE                   | PERIOD                                         | SOURCE                            |

## 05 District-by-District Snapshot

| DISTRICT      | ACTIVITY                       | EMPLOYMENT                               | WAGES                           | PRICES               |
|---------------|--------------------------------|------------------------------------------|---------------------------------|----------------------|
| Boston        | Slight growth                  | Flat; entry-level hiring soft, AI-linked | Small gains                     | Slight increase      |
| New York      | Slight growth (after weakness) | Slight uptick; finance/tech shed jobs    | Modest, easing                  | High end of moderate |
| Philadelphia  | Slight decline                 | Declined (mfg. & nonmfg.)                | Modest, steady                  | Moderate             |
| Cleveland     | Moderate growth                | Modest growth (best in System)           | Moderate                        | Robust               |
| Richmond      | Modest growth                  | Unchanged                                | Modest                          | Moderate             |
| Atlanta       | Modest growth                  | Flat to down slightly                    | Modest (2–3%)                   | Moderate             |
| Chicago       | Slight growth                  | Slight growth                            | Modest                          | Rapid                |
| St. Louis     | Slight growth                  | Unchanged                                | Moderate                        | Robust               |
| Minneapolis   | Modest growth                  | Slight growth                            | Modest to moderate              | Sharp                |
| Kansas City   | Slight growth                  | Little to no change                      | Modest                          | Moderate             |
| Dallas        | Modest growth                  | Largely flat                             | Modest (svcs.); moderate (mfg.) | Rising, fuel-driven  |
| San Francisco | Flat / stable                  | Unchanged                                | Slight                          | Moderate             |

## 06 Labor Market Deep Dive

---

### "Low-hire, low-fire" is the defining phrase of this cycle

Firms are hoarding the workers they have — separations stay low (BLS JOLTS puts the layoff rate at just 1.1%) — while hiring has slowed sharply (quits rate down to 1.9%, near cycle lows). The effect, as St. Louis Fed research on this exact dynamic notes, is fewer new openings, less job-to-job switching, and a much harder path in for new entrants, even though the headline unemployment rate (4.3%) looks unremarkable because layoffs aren't rising.

### Entry-level and young workers are absorbing the brunt of it

Boston staffing contacts reported "weaker demand for entry-level workers... possibly driven by AI." New York's upstate staffing contacts reported "a surplus of entry-level workers on the market." Dallas Fed research quantifies this: employment among 22–25 year-olds in the most AI-exposed occupations has fallen 13% since 2022, even as overall employment grew.

### AI is a hiring substitute more than a mass displacer — so far

Multiple Districts describe AI reducing the *need* to hire rather than triggering layoffs. Challenger-type layoff tracking cited AI explicitly in 54,836 announced 2025 layoff plans plus 12,304 more in early 2026 — a small share of total separations, but a fast-growing one. Wall Street banks alone have announced plans to cut roughly 200,000 jobs over three to five years, concentrated in entry-level and back-office roles. Kansas City Fed contacts described a more advanced version: firms shifting back-office and professional functions (accounting, medical transcription, database management) to offshore providers who have adopted AI faster than domestic operations.

### Immigration enforcement is creating visible, localized labor shortages

Academic research (Gutiérrez-Li, *Journal of the Agricultural and Applied Economics Association*, 2026) finds that unexpected immigration-enforcement arrests reduce labor force participation among noncitizen farmworkers by up to 3.4 percentage points and weekly hours by up to 23.1%. Nationally, agricultural employment fell 155,000 from March–July 2025 versus a 2.2% increase over the same window a year earlier. Construction faces a parallel gap — Associated Builders and Contractors estimates the industry needs 349,000 additional workers in 2026 — consistent with Beige Book anecdotes from Boston (landscaping wage spikes) and Minneapolis (a manufacturer whose turnover rose over 10% after losing access to immigrant labor).

### Skilled trades and credentialed manufacturing labor remain genuinely tight

Even as white-collar hiring cools, Richmond architecture/construction firms report being unable to complete projects for lack of workers, Philadelphia auto-repair and manufacturing contacts

cite a persistent lack of technicians, and a Kansas City aerospace contact described lowering credential requirements to fill technical roles.

### Wage growth is increasingly reactive, not structural

Instead of broad raises, firms across multiple Districts are issuing targeted cost-of-living adjustments tied directly to fuel and living costs — gas bonuses, fuel stipends, off-cycle adjustments — consistent with a labor market responding to a cost shock (headline CPI 4.2% YoY) rather than genuine wage-price spiral tightness.

## 07 Literature Review

---

**METHOD NOTE** This section synthesizes institutional and peer-reviewed research most relevant to interpreting the Beige Book as a labor-market and recession signal — how reliable text-based Fed sentiment has historically been at forecasting turning points, what's driving the "low-hire, low-fire" pattern, how AI and immigration enforcement are showing up in labor supply/demand research, and how well-documented the K-shaped consumption divergence actually is in the data. Sources are institutional (Federal Reserve Banks, BEA, BLS) and peer-reviewed/working-paper research; all are dated 2024–2026 to stay current with this cycle.

| SOURCE                                                                                                                                                                         | TYPE                                                          | KEY FINDING                                                                                                                                                                                                             |

| NY Fed, Liberty Street Economics, "Tracking the K-Shaped Economy: Who's Driving Spending?" & "Explaining the K-Shaped Economy," May 2026 | Fed research blog (two-part series)       | Confirms only high-income households show consistent real spending growth since 2023; middle-income spending stalled for extended periods, and the income-based spending gap is the widest since early 2022.                                      |
| Bank of America Institute internal transaction-data analysis, Feb. 2026                                                                  | Bank proprietary data / industry research | Corroborates NY Fed findings using card-transaction data: spending growth for higher-income cohorts stable Jan. 2025–Jan. 2026 while lower/middle-income growth slowed materially.                                                                |
| Atlanta Fed, "K-shaped Economy or Not? Evidence from a Payments Survey," May 2026, <i>Policy Hub</i>                                     | Fed working paper                         | Uses a nationally representative payments-diary survey (rather than bank transaction samples) to stress-test the K-shape thesis — a useful methodological counterpoint on whether the divergence is as wide as transaction-based studies suggest. |

Synthesis

**On predictive validity:** the research consensus is that Beige Book-derived sentiment was a genuinely reliable recession signal for roughly 35 years (mid-1980s–2020) but has since decoupled from realized outcomes, generating repeated false positives. That doesn't make it useless — the Cleveland Fed's own team continues to publish and refine the model — but it means today's elevated Beige Book pessimism (mid-20s percent recession probability per the text model) should be weighted as one input among several, not treated as a forecast in its own right. The more durable finding across this literature is that Beige Book anecdotes carry *incremental* information about where hard data is headed, particularly at the sector and regional level, even when the aggregate national recession call is unreliable.

**On labor markets:** St. Louis Fed and Dallas Fed research independently corroborate what the Beige Book anecdotes describe — a labor market where the pain is concentrated in reduced *opportunity* (hiring, mobility, entry-level access) rather than rising *separations*. This is consistent with why rate-based indicators like the Sahm Rule remain quiet: those indicators are built to catch layoff-driven downturns, and this cycle's stress pattern is structurally different.

**On AI and immigration as labor-supply/demand shocks:** both bodies of research show effects that are real, measurable, and concentrated in specific cohorts (young/entry-level workers; noncitizen and immigrant-dependent sectors) rather than economy-wide. Neither shows up cleanly in the national unemployment rate, which is exactly why the Beige Book's District-level, sector-level anecdotes have added value here.

**On the K-shaped economy:** this is now one of the best-documented divergences in current Fed research, corroborated by two independent NY Fed studies, Bank of America's proprietary

transaction data, and Beige Book anecdotes across at least four Districts (New York, Cleveland, Richmond, Atlanta). The one methodological caution, per the Atlanta Fed's payments-survey work, is that bank-transaction-based studies may overstate the divergence somewhat versus nationally representative survey data — worth keeping in mind before treating the K-shape as settled fact rather than a well-supported but still-debated pattern.

## 08 Recession Signals vs. Strong-Economy Signals

### WEAKNESS Pointing toward recession risk

- Consumer spending clearly bifurcating by income (NY Fed, BofA Institute); middle/lower-income households cutting visits, increasing card reliance.
- Aggregate delinquency at 4.8% of balances; auto delinquency at a series record, credit-card delinquency near 2008-crisis levels (NY Fed, Q1 2026).
- Nonprofits across nearly every District report a "newly needy" surge alongside shrinking donations — a hardship indicator that lags official poverty data by a year or more.
- Home sales weakening in Philadelphia, Atlanta, Dallas, San Francisco; builders in Atlanta "can't give a house away" even with incentives.
- Headline CPI at 4.2% YoY, highest since April 2023, on a cost-push energy shock hitting an already-slowing consumer — textbook stagflation ingredients.
- Consumer sentiment near record lows (44.8 in May, the lowest on record, before a partial June rebound to 49.5).

### RESILIENCE Pointing toward continued growth

- 10 of 12 Districts still growing; manufacturing expanding in 9 of 12 on data-center and defense demand.
- Layoff rate just 1.1% (JOLTS, May 2026); initial claims range 215k–229k, well below recessionary norms.
- Sahm Rule and Richmond Fed's SOS indicator remain below trigger thresholds as of mid-June 2026.
- Fed held rates steady at 3.50%–3.75%; no emergency action signaled.
- Q1 2026 real GDP grew 2.1% (third estimate), an acceleration from 0.5% in Q4 2025.
- Higher-income consumer spending remains genuinely strong (luxury goods, travel, real estate), supporting aggregate demand.

## 09 What Standard Economic Data May Be Missing

---

The section most directly useful for decisions — where the Beige Book and the research literature above are likely to lead the official numbers rather than confirm them.

- **The unemployment rate can't see a hiring freeze.** Sahm Rule-style indicators require the unemployment rate to rise, which requires layoffs. A 1.1% layoff rate alongside a 1.9% quits rate describes paralysis, not contraction — and paralysis can persist a long time without ever tripping a rate-based indicator.
- **Averages hide the K-shape.** Aggregate retail sales or PCE can look "fine" while NY Fed and BofA data show a widening gap that's largest since early 2022 — a divergence official income-distribution data won't reflect for months.
- **A model built directly on Beige Book language currently reads higher than official indicators.** The Cleveland Fed's text-sentiment model (mid-20s percent recession probability) runs above what Sahm/claims data implies — a real, published divergence between the tone of business commentary and the hard numbers, even accounting for the model's known post-2022 unreliability.
- **Regional and sectoral divergence disappears at the national level.** Philadelphia is contracting while Cleveland grows moderately; data-center/defense manufacturing booms while consumer retail and housing soften almost everywhere. A national GDP or unemployment print smooths all of this into one number.
- **Delinquencies lead charge-offs by two to three quarters.** NY Fed data already shows record auto delinquency and near-2008 credit-card delinquency; official consumer-distress and default statistics typically confirm this trend with a multi-quarter lag.
- **Geopolitical cost pass-through moves faster than CPI captures it.** Beige Book contacts described fuel surcharges and grocery price increases in real time; CPI sampling confirms this with a one-to-two month lag, and core-CPI treatment may understate the speed of pass-through into non-energy categories.
- **AI and immigration-driven labor shocks are cohort- and sector-specific.** A 13% employment decline among AI-exposed 22–25 year-olds, or a 3.4-point drop in noncitizen farmworker labor-force participation after enforcement surges, is invisible in the national unemployment rate but very visible in Beige Book anecdotes and the underlying academic research.

## 10 Implications for Labor Market Decisions

---

### If hiring

Expect a larger, more qualified candidate pool than a 4.3% unemployment rate would suggest — low quits (1.9%) mean people aren't leaving voluntarily, but soft demand and AI/offshoring pressure on white-collar and entry-level roles mean the *available* pool skews more experienced. Skilled trades and roles tied to data centers, defense, or AI infrastructure remain genuinely competitive and may require wage premiums; back-office and administrative roles face real offshoring/AI substitution risk documented in both Beige Book anecdotes and Dallas Fed research.

### On compensation

Budget for reactive, cost-of-living-style adjustments (fuel/energy-linked) rather than broad merit increases — consistent with 4.2% headline CPI and what employers are actually doing across nearly every District right now.

### On retention

Turnover is low almost everywhere (1.9% quits rate), which lowers retention costs but also reflects anxiety-driven stability rather than confidence-driven loyalty — several contacts describe employees as "nervous and stressed" and unwilling to risk leaving stable jobs. Retention plans built purely on today's low quit rates may prove fragile once conditions ease.

### On sector exposure

Consumer-facing discretionary retail, hospitality, and residential real estate are most exposed to further softening if energy prices stay elevated (WTI has already ranged from \$57 to \$113 to \$76 this year); manufacturing tied to data centers, defense, and infrastructure is the most durable growth pocket and the one place still showing genuine hiring intent.

### On monitoring

Don't rely solely on the monthly unemployment rate or Sahm Rule for early warning. Track: initial claims trend (best real-time layoff gauge), NY Fed delinquency data by category (released quarterly), the Cleveland Fed's Beige Book-text recession probability, and the next two Beige Books (due roughly every 6–8 weeks) for whether "low-hire, low-fire" starts tipping into outright layoffs — the actual trigger that would move this from "soft landing under strain" to recession.
